

Teach yourself how to build a Business Case for any industry including mining

1d Hands On Modelling – a typical worksheet

This module is absolutely fundamental!!!

This module is absolutely fundamental!!!

Spend only a few seconds/minutes on each page

This website may contain errors so always check your own work and have it audited by a competent person.

Building a business case has activities on three levels ...

Level 3: Decision making

Level 2: Evaluating the business/project

Level 1: Hands-on business modelling

The purpose of this module is to show how to layout a worksheet

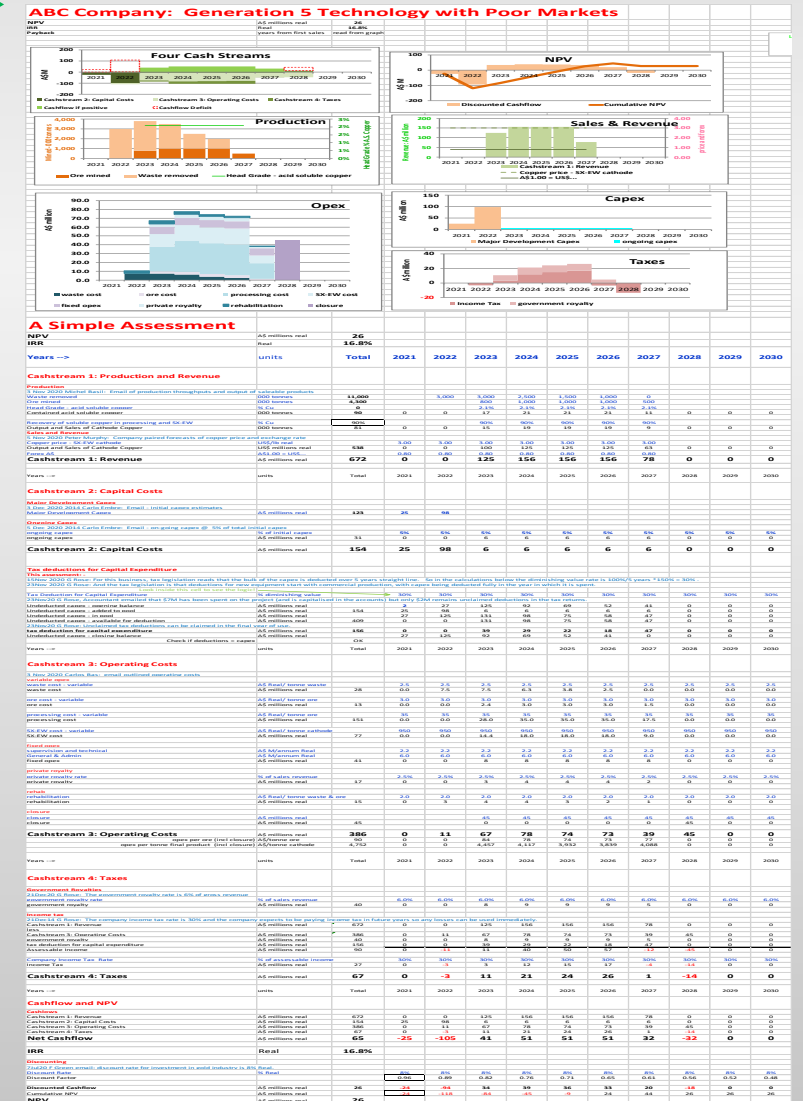

Typical worksheet architecture ...

i. Title →

ii. Summary

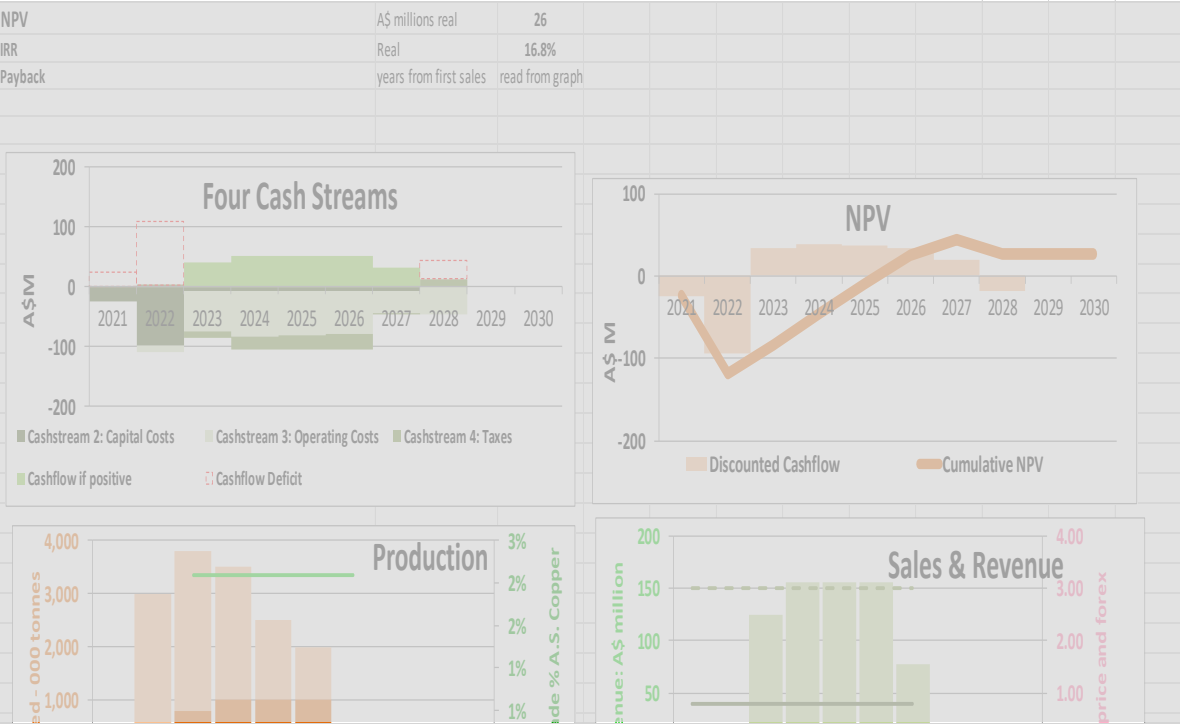

iii. Workings

Typical worksheet architecture...

i. **Title = bold and descriptive**

ABC Company: Generation 5 Technology with Poor Markets

Aspendale Beach: Richard Newton

Typical worksheet architecture...

i. Title – bold and descriptive

ii. Summary ...

Numeric Summary

(Key metrics ... NPV, IRR, Payback, key prices ...)

Visual Summary

These graphs instantly reveal the viability of the business/project with these underlying input assumptions.

- outputs
- Inputs

ABC Company: Generation 5 Technology with Poor Markets

NPV	A\$ millions real	26
IRR	Real	16.8%
Payback	years from first sales	read from graph

Aspendale Beach: Richard Newton

A wide-angle photograph of a beach at low tide. The foreground is dominated by intricate, wavy patterns in the sand, likely created by receding water. The sand is a light tan color. To the right, the beach transitions into a darker, wet area with some seaweed. The sea is calm and extends to the horizon under a clear, bright blue sky. The horizon line is straight and divides the image roughly in half.

Aspendale Beach: Richard Newton

Unfortunately, **hack modellers** will be in frantic rush to report the NPV/IRR. They will feel too pressed to take a few extra minutes to create these graphs.

1. find their own errors
2. find colleagues' errors, and
3. to give rapid understanding to others

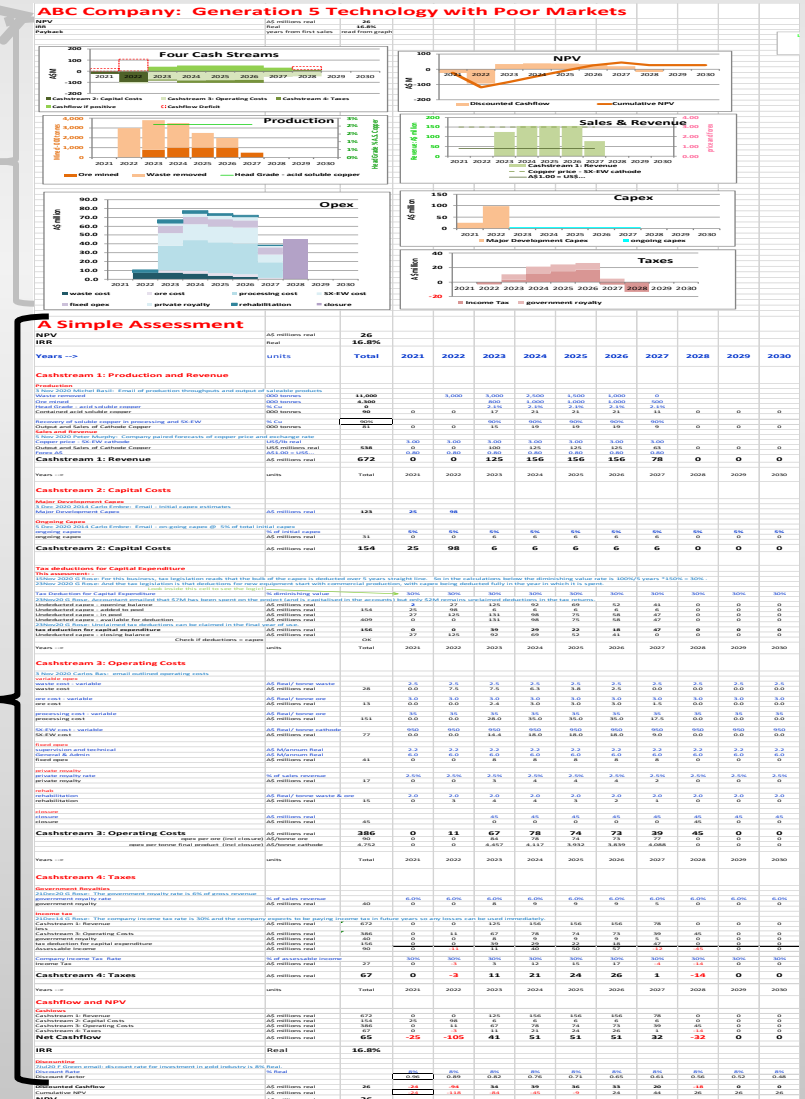

Typical worksheet architecture...

i. Title

ii. Summary

iii. Workings

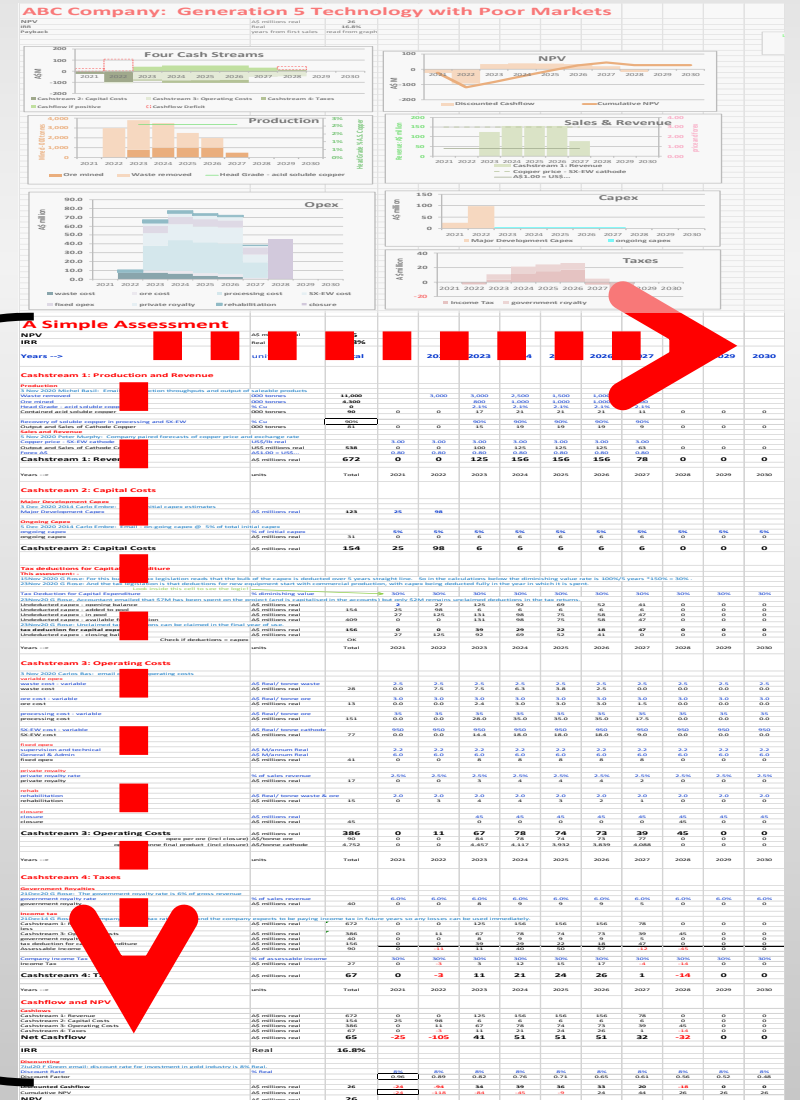

Typical worksheet architecture...

iii Workings

It is essential that the Workings be **intuitive**:-

- **down** the worksheet and
- **across** the worksheet

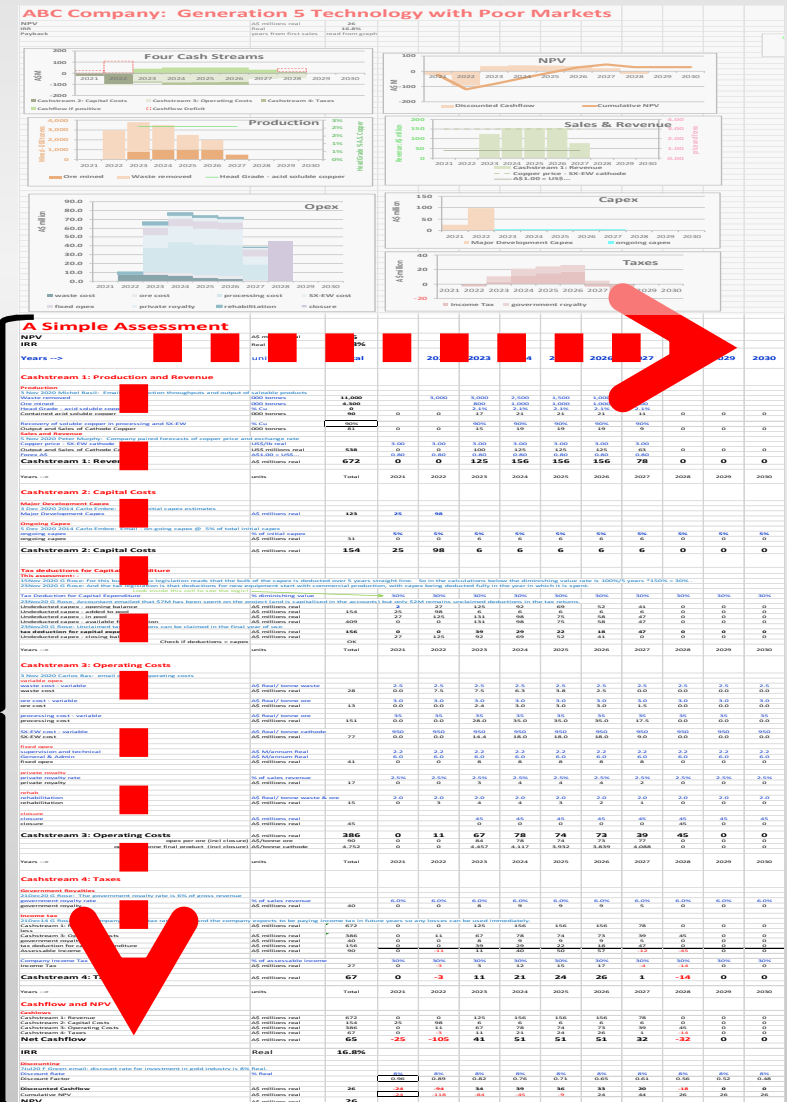

The Workings will be **intuitive** if you do this:-

Down the worksheet use ...

- Discrete work blocks
- Bold headings
- Obvious totals
- Colour coding
- Row notes above input data
- Small steps

Across the worksheet use ...

- No set-backs of columns
- Every descriptor & unit is given full meaning
- Totals always are visible on the left hand side
- Columns D and E are prime locations
- Years are consistent in every worksheet
- No hidden rows or columns and nor hidden worksheets
- Try modelling with the window split

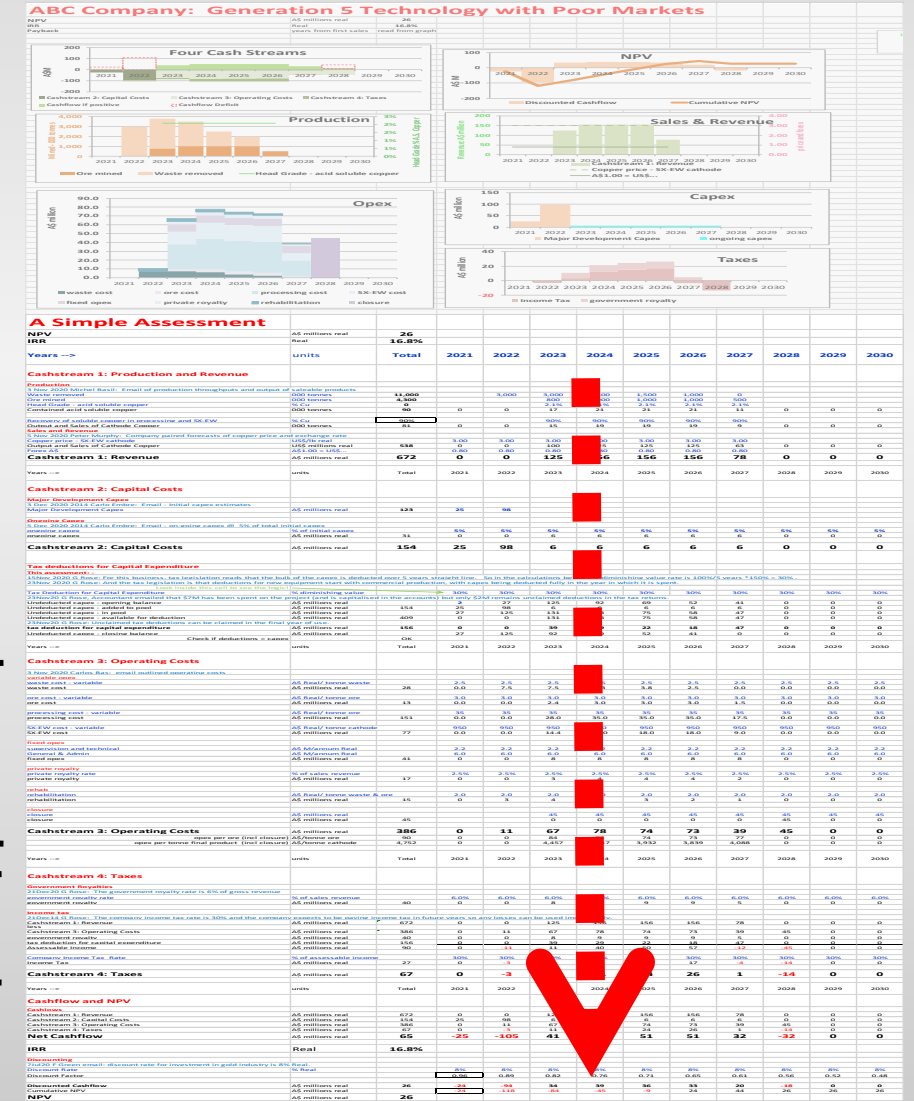

Making your model **intuitive down** each worksheet: -

i. Discrete major work blocks.

In this example, the whole evaluation down to cash flows is in five discrete & self-contained work blocks: -

- 1) Sales, operations & revenue – self contained
- 2) Capital costs – self contained
- 3) Operating costs – self contained
- 4) Taxes – self contained
- 5) Net cash flows → NPV, IRR, payback, etc – self contained

Most important: Make each discrete work block 'self-contained' so the inputs, computations and results are visually obvious within each block

Making your model **intuitive down** each worksheet: -

i Discrete work blocks for sub-sections.

And **within** each major discrete work block, make each sub-section a discrete work block with:

- obvious inputs,
- obvious computations and
- obvious results.

- Sub-section #1 self contained work block
- Sub-section #2 self contained work block
- Sub-section #3 self contained work block
- Sub-section #4 self contained work block
- Sub-section #5 self contained work block

Bring these sub-sections into an obvious total

Undeducted capex - in pool	A\$ millions real		27	125	131	98	75	58	47	0	0	0

Making your model **intuitive down** each worksheet: -

- i. Discrete work blocks.
- ii. Bold headings
- iii. Obvious totals
- iv. **Colour coding of:**
 - a) **Input data**
 - b) **Referenced data**
 - c) **Computations & results**

This example is very easy to understand: -

Green means the data is 'referenced' across from another worksheet in the same model

Blue means it is fresh data input

Black means it is a computation or output

Years -->	units	Total	Year 1	Year 2	Year 3

Tank ex-factory	US\$ Real/unit		260	260	260
Tank manufacturing costs	US\$ 000 Real		125	364	1,303
Variable Costs - selling direct units					

The following commonly used colour coding:

- *is easy to adopt*
- *greatly reduces errors*
- *most importantly, it makes the model far easier for others to readily follow*

i. Input data

Sales	units	3085	3150	3246	3449
-------	-------	------	------	------	------

Many people use blue colouring for inputs of fresh data into the model. **Most importantly:** Fresh data from outside is entered only *ONCE* in the entire model. It *NEVER* is re-entered in another part of the model. This includes defining the years or months only *ONCE* in the entire model!

ii. Referenced data (not 'Links')

Sales	units	3085	3150	3246	3449
-------	-------	------	------	------	------

If fresh data has already been entered in one worksheet and is required in another worksheet, then it needs to be 'referenced' across. Similarly, results calculated in one worksheet that are needed in another worksheet need to be referenced across. Reference across the whole row including descriptor, units, total, etc). I use green font. (*This is not "LINKS" to another model or workbook – "LINKS" should be absolutely avoided!*)

(Easy method: when in the empty cell that will receive the referenced data, press the "=" key, move to the worksheet where the data has been entered and put the cursor on the cell with the data. Press "enter" key.

Once the years (or months) have been entered in one worksheet then every other worksheet must 'reference' that row of years (or months). Do not re-enter the years (or months) again.

Year	2024	2025	2026	2027
------	------	------	------	------

To avoid errors and to make the model intuitive: When creating an algorithm in one worksheet, do not directly reference a cell in another worksheet so that it is hidden/covert in the algorithm. To be intuitive, every algorithm must only use cells that are already visible in that same worksheet. So reference the whole row across into an empty row above where it is needed in the algorithm. Make the logic visual.

iii. Computations & Results

Use black font on white.

Revenue	\$000	983	1256	1110	1344
---------	-------	-----	------	------	------

iv. Colour coding of:

- a) Input data
- b) Referenced data
- c) Computations & results

Evaluation specialists who love using sophisticated Excel, usually scoff at colour coding.

- *They are in too much of a rush to pump out results.*
- *They do not realise that the model is merely a working tool for other people, as well as for themselves.*
- *Ironically, they grow proud of their convoluted, 'leading edge' model in black & white that few, if anyone else, can bother trying to follow. Therefore almost no-one else can trust their model.*

Colour coding brings your work closer to your colleagues - once they understand its meanings

Making your model **intuitive down** each worksheet: -

v. A row note above each set of fresh input data

- State when, what, who (use blue font to match the input data)
- Make it visible

Other people can immediately recognise its validity and currency

(Do not use cell notes because they cannot be readily read by others trying to quickly understand your model and they tend to become unwieldy, out dated and forgotten.

ore cost	A\$ millions real	182	0.5	1.7	8.0

Making your model **intuitive down** each worksheet: -

vi. Small steps

In this example, the operating cost are computed in nine simple steps.
They would be: -

- easy to follow,
- fast to check,
- make errors obvious,
- be intuitive and
- leave everyone feeling confident!

Poor modellers would combine these nine steps into long and perhaps sophisticated algorithms: -

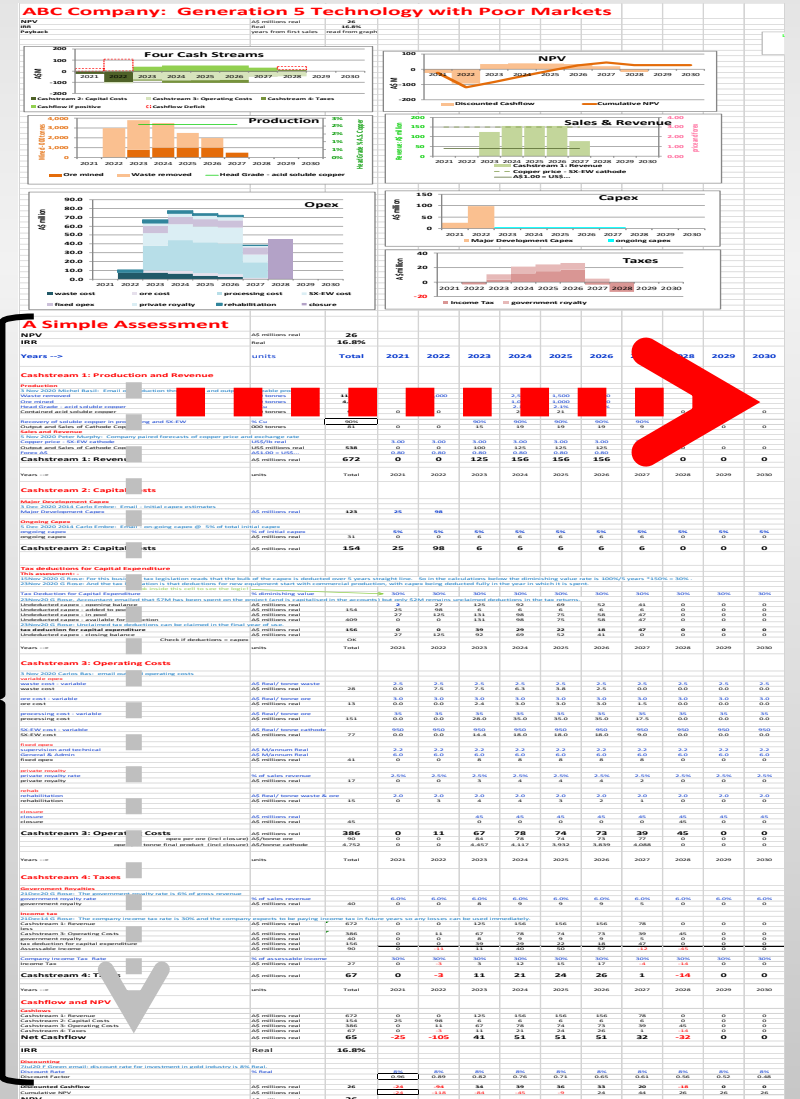

- They would feel so clever and fast!
- But colleagues could not immediately follow calculations.
- The model would be tedious to check.
- Errors would be hidden
- other people would lose interest and trust.
- Their models are liable to become irrelevant ‘trophies’.

Typical worksheet architecture...

The Workings must be **intuitive**:-

- down the worksheet
- **across** the worksheet

Aspendale Beach: Richard Newton

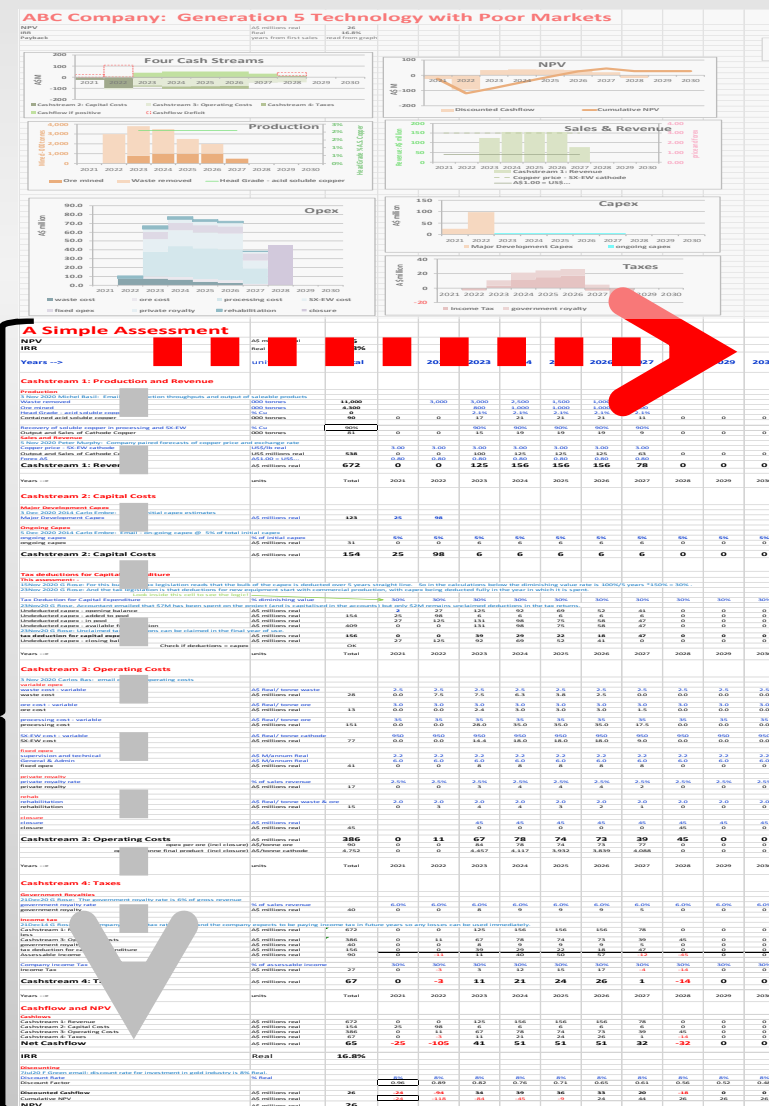

The Workings will be **intuitive** if you do this:-

Down the worksheet use ...

- i. Discrete work blocks
- ii. Bold headings
- iii. Obvious totals
- iv. Colour coding
- v. Row notes above input data
- vi. Small steps

Across the worksheet use ...

- i. No set-backs of columns
- ii. Every descriptor & unit is given full meaning
- iii. Totals always are visible on the left hand side
- iv. Columns D and E are prime locations
- v. Years are consistent in every worksheet
- vi. No hidden rows, columns or worksheets
- vii. Try modelling with the window split

Making your model **intuitive across** each worksheet: -

i. **Avoid column ‘set backs’**

Columns A and B should **not** be set-backs for headings and sub-headings.

	Years -->	units	Total	Yr 1	Yr 2	Yr 3	Yr 4

3 Dec 2020 2014 Carlo Embre: Email - Initial capex estimates							
Major Development Capex	A\$ millions real	123	25	98			
Ongoing Capex							
5 Dec 2020 2014 Carlo Embre: Email - on-going capex @ 5% of total initial capex							
% of initial capex			5%	5%	5%	5%	
A\$ millions real		31	0	0	6	6	
	A\$ millions real	154	25	98	6	6	
business, tax legislation reads that the bulk of the capex is deducted over 5 years straight line. So in the calculations below the diminishing value method is used. And the tax legislation is that deductions for new equipment start with commercial production, with capex being deducted fully in the year in which it is incurred.							
Look inside this cell to see the logic!							
Tax Deduction for Capital Expenditure	% diminishing value		30%	30%	30%	30%	
23Nov20 G Rose, Accountant emailed that \$7M has been spent on the project (and is capitalised in the accounts) but only \$2M remains unclaimed deductions in the accounts							
Undeducted capex - opening balance	A\$ millions real		2	125	92		

Some modellers think this offsetting of columns is organised and attractive. But it adds clutter, wastes vital columns, is unnecessary and therefore makes it harder for others to follow!

Making your model **intuitive across** each worksheet:

- **ii. Every descriptor & unit is given full meaning**

Descriptors in Column A and units in Column B are clearly defined.

Do not use abbreviations or code. Do not make others guess. Do not be lazy or in a rush.

Use full meanings so others do not have to pause and try to work out the exact meaning of ‘sales’, ‘price’, ‘cost’, ‘M’, ‘m’ ... etc

Column A is
for headings,
descriptors,
row notes

Column B is
for 'units'

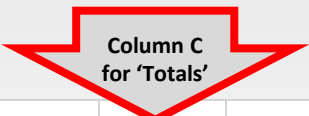

Years -->	units	Total	Year1	Year2
Cashstream 1: Production and Revenue				
Production				
3 Nov 2020 Michel Basil: Email of production throughputs and output of saleable products				
Waste removed	000 tonnes	11,000		3,000

Years -->	units	Total	2021	2022	2023	2024	2025	2026	2027	2028

Make your model **intuitive across** each worksheet: -

iii. and every row of data must be totalled:

Input Data: Do a rigorous check of the total of each row of input data against the corresponding total in the source of that data. This is a vital, quick check to eliminate errors in your input data

Output Totals: Do a sense check of each output total. Does it seem reasonable?

So many models have been created where the modeller was in too much of a hurry to complete these simple row totals.

Without these simple totals how do you know if each row of input data is correct?

Years -->	units	Total	Year1	Year2	Year 3	Year 4	Year 5	Year 6	Year 7	Year 8
Cashstream 1: Production and Revenue										
Production										
3 Nov 2020 Michel Basil: Email of production throughputs and output of saleable product

Years -->	units	Total	2021	2022	2023	2024	2025	2026	2027	2028

Make your model intuitive across each worksheet: -

Too many models have been created in a rush where row totals have been omitted. The model's creator was pre-occupied with getting numeric results like NPV and IRR. They lacked the personal discipline of taking time to check their input data.

Sloppy!
Incompetent!

By contrast a competent professional will continuously check the accuracy of the input data by quickly comparing totals with the source data. Similarly the totals of each row of output data can be sense checked.

professional will
accuracy of the input data
als with the source data.
ch row of output data can

		Total	Year1	Year2	Year 3	Year 4	Year 5	Year 6	Year 7	Year8
	and output of saleable products

Years -->	units	Total	2021	2022	2023	2024	2025	2026	2027	2028

Make your model **intuitive across** each worksheet: -

iv. Columns D and E are prime locations:

Sometimes they will be needed for opening data or historical data.

But preferably the columns to the right of “Total” get straight into action.

They should not be stores of unused history or be largely empty ‘in reserve’.

It is frustrating when working your way through a workbook to discover the reason you could not follow the logic quickly was because a few **rows are hidden**, or because a few **columns are hidden** or because a few **worksheets are hidden**.
(The '**Grouping**' function should be used because the symbols make it obvious)

Modelling tip: Splitting the screen :-

vii. Try modelling with the window split so you always see what is happening in your final columns:

The total is obvious on the left hand side, you can see the first years and you can always see the last years

This will increase your confidence because you can instantly check what is happening in the final years/months

This will increase your speed by using the 'Shift' key to copy and paste formulas from Year 1 right across to the final year.

Months -->	units	Total	Month 1	Month 2	Month 3	Month 4	Month 5	Month 6	Month 7	Month 8	Month 9	Month 10	Month 46	Month 47	Month 48
Social Enterprise - Activity															
2018 09 05 Y Khani: "Business Plan for Organic Fertiliser Business in Villages" page 3															
Activity -->			Receive approvals and funding	Start construction of workshops	Construct waste receival	Start constructing processing plant		Complete construction & raise working capital	First sales	Ramp-up sales	Ramp-up sales	Ramp-up sales			
Cashstream 1: Sales & Revenue															
1a . Sales															
2018 09 05 J Hui: "Marketing report on the Sales of Organic Fertilisers in Villages" page 6															
sales of organic fertiliser	kilograms	2,640,537		18,000	20,000	22,000	24,000	27,000	30,000	33,000	36,300	39,930	64,308	64,308	64,308
price of organic fertiliser - including 10% VAT	\$/kg Real	0.21							0.22	0.22	0.22	0.22	0.22	0.22	0.22
Revenue - organic fertilisers	\$ Real	556,498	0	0	0	0	0	0	6,600	7,260	7,986	8,785	14,148	14,148	14,148
1b. Debtors															
2018 09 05 P Carr email: Farmwrs will be required to pay cash on purchase so there will not be debtors															
Cashstream 1: Revenue	\$ Real	556,498	0	0	0	0	0	0	6,600	7,260	7,986	8,785	14,148	14,148	14,148
Cashstream 2: Capital Costs															
Capex - Start up and sustaining															
2018 09 05 J Lee: "Construction of Organic Fertiliser Plant" page 3															
Green waste receival	\$ Real	4,000			4,000										
Mulching and mixing plant	\$ Real	7,000				7,000									
Processing plant	\$ Real	18,000				6,000	6,000	6,000							
Despatch facilities	\$ Real	3,000						3,000							
workshop and office	\$ Real	10,000		5,000	5,000										
sustaining - replacement of whole units of equipment	\$ Real	39,000								1,000	1,000	1,000	1,000		
Cashstream 2: Capital Costs	\$ Real	81,000	0	5,000	9,000	13,000	6,000	9,000	0	1,000	1,000	1,000	1,000	0	0
Months -->	units	Total	Month 1	Month 2	Month 3	Month 4	Month 5	Month 6	Month 7	Month 8	Month 9	Month 10	Month 46	Month 47	Month 48

Most important: the Workings must be intuitive:-

Down the worksheet

- Discrete work blocks
- Bold headings
- Obvious totals
- Colour coding
- Row notes above input data
- Small steps

Across the worksheet

- No set-backs of columns
- Every descriptor & unit is given full meaning
- Totals always are visible on the left hand side
- Columns D and E are prime locations
- Years are consistent in every worksheet
- No hidden rows, columns nor worksheets
- Try modelling with the window split
